NIS-2 and KRITIS Dachgesetz (CER law)**

The NIS-2 Directive is an EU-wide regulation aimed at strengthening cybersecurity, replacing the previous NIS Directive. It requires companies and public institutions in critical sectors – such as energy, healthcare, transportation, digital services, and public administration – to implement comprehensive IT security measures.

The KRITIS Framework Act is a proposed German law aimed at enhancing the physical security and resilience of critical infrastructures. It transposes the European CER Directive (Critical Entities Resilience Directive) and complements existing cybersecurity regulations, such as the NIS-2 Directive. The law obligates operators in eleven critical sectors – including energy, healthcare, transportation, water, food, and administration – to implement specific measures, such as access controls, emergency plans, risk assessments, and reporting obligations.

LINNEMANN GmbH is not subject to the obligations of the KRITIS Framework Act or the NIS-2 Directive. However, the company proactively implements key measures from the NIS-2 Directive to protect itself against cyberattacks and other threats. In doing so, LINNEMANN GmbH addresses not only digital security aspects but also enhances physical security, for example, through biometric access controls and targeted cybersecurity measures to improve operational resilience.
